

Pool & Spa Hardness

DESCRIPTION

Pool & Spa Hardness raises calcium hardness of pool and spa water to assist in the prevention of corrosion, etched plaster and other problems resulting from low calcium levels

Product Information

This product is used to raise the calcium hardness in pool water. Low calcium hardness may cause pool water to be corrosive which may result in staining, etching or distorting of all types of pool surfaces. Surface etching by low calcium hardness will become more abrasive and uncomfortable for bathers. Rough surfaces also increase problems with algae and makes cleaning more difficult.

Directions for use

Ideal bathing conditions exist at a slightly alkaline pH level of 7.2--7.6, with alkalinity of 80/150 mg/l. This range will also allow the most effective use of other swimming pool chemicals.

Use Pool & Spa Hardness Increaser at the rate of 100 g per 10m³ to raise calcium hardness by 10 mg/l. Dissolve the required amount of Pool & Spa Hardness Increaser in a clean container with clean water and pour slowly around the perimeter of your pool and spa. Ensure both the pump and filter are running to circulate the product effectively.

Re test and make any further additions as required.

Code: 161162419

Pool & Spa Hardness

raises calcium hardness of pool
and spa water

Features

- For Pool, spas and hot tubs
- Raises calcium hardness level
- Helps prevent etching and staining
- 100% active

Benefits

- Multi-use product

PRODUCT CHARACTERISTICS

Appearance: White

Form: Granules

Solubility in water: Soluble
